

FULL-STACK SOFTWARE & BUSINESS APPLICATIONS

Lee Noah | Full-stack development, business applications & automation

Since leaving employment in 2025, I have developed my own photo-studio software ecosystem and a broader portfolio of business applications. My brand generated KRW 300 million in revenue in 2025 and has grown to 14 locations. Its software includes unattended store systems, photo/preset programs, a browser photo editor and operational automation. The examples below show how I translate business requirements into applications and integrations.

01 / Photo-studio Customer Applications

Developed Boothy and Boothy Selectroom for photo/preset and unattended-store workflows, alongside CutEditor, a React/TypeScript/Konva editor for layouts, text, frames, recolorable stickers and export. Camera-connected desktop workflows include viewer-readiness and operator controls; touch interactions and save fallbacks support browser editing.

Built a separate booking/SMS workflow for confirmations, pre-visit guidance and service-option handling. Together, the applications connect the customer journey from reservation through in-store photography and editing.

Business value: gives the photo-studio brand its own customer experience and operating tools.

Technical depth: React, TypeScript, Konva, Tauri/Rust and Python integrations.

02 / Multi-location ERP & Photo Fulfillment

Business need: coordinate branch reports, staff pay, customer requests and outsourced photo production without relying on disconnected records and manual handoffs.

Implementation: built mobile shift reporting, onboarding, payroll, retouch-order intake and vendor workspaces. Historical wage and intake-price snapshots preserve each transaction's original basis. Connected file intake, worker assignment, delivery, revisions and ERP settlement through idempotent handoffs and retry handling.

Business contribution: gave a growing operation a repeatable way to manage people, customer work and payments. The software supports the day-to-day workflows behind a photo-studio brand that generated KRW 300 million in 2025 revenue.

Technical depth: TypeScript, Next.js, PostgreSQL/Prisma, Cloudflare Workers; Apps Script, Drive, Cloud Run and Firestore for fulfillment; access scopes, audit history, trusted upload manifests and background processing.

COMMERCE, CRM & FINANCIAL WORKFLOWS

Selected software implementations | 2025-Present

03 / Commerce Operations & Customer Lifecycle CRM

Business need: connect sales channels, customer behavior and operational records so teams can act on a coherent view rather than reconcile disconnected tools.

Implementation: built separate commerce operations and CRM platforms. Integrated Cafe24 and marketplace data for orders, refunds, inventory, fulfillment and settlements; added behavioral collection, lifecycle views, campaign inputs, source-specific synchronization records and daily reconciliation.

Business value: exposes collection gaps and operating exceptions before reports inform fulfillment, retention or merchandising. Permissions and audit records make sensitive actions accountable.

Technical depth: Next.js, NestJS, TypeScript, PostgreSQL/Prisma, background workers and Docker, with backup-restore checks and rollback-aware release scripts.

04 / Inventory & Finance Operations ERP

Business need: keep headquarters and branch records aligned while avoiding misleading margin figures from incomplete stock data or silent changes to closed records.

Implementation: built sales, expenses, inventory, losses, margin and closing views. Added FIFO completeness checks, required reasons and before/after audit history for post-close corrections, plus accounting-file imports with mapping previews, file-hash deduplication and atomic commit/rollback.

Business value: makes financial review explainable and external accounting imports traceable.

Technical depth: Next.js, PostgreSQL/Prisma, role/action authorization, ExcelJS and Playwright.

05 / Service Operations ERP

Implemented room coordination, service-call entry, staff assignment, settlements, monthly closing and audit review. Role-based access and month-lock guards control payout-affecting changes. This provides a defined operating process for service teams and a reviewable record for management.

Technical depth: Next.js, TypeScript, PostgreSQL/Prisma, authentication, validation, audit records and unit/E2E test suites.

SPECIALIZED APPLICATIONS & AUTOMATION

Selected software implementations | 2025-Present

06 / Meal Enrollment & Settlement

Built a member-to-settlement workflow covering approval, monthly meal enrollment, mobile tickets, ticket transfers and administrator exceptions. Transactional database rules and role-scoped access keep eligibility and settlement logic consistent across user actions.

Business value: standardizes enrollment and ticket handling while making cutoffs and exceptions visible. Technical depth: React, TypeScript, Supabase PostgreSQL/Auth/RLS, database functions and Playwright.

07 / Private Baemin Delivery Operations Product

Business need: keep delivery-operations workflows, team updates and monitoring reliable across browser-based work without exposing operational source.

Implementation: built and operated a private product with local browser agents and a central backend for scheduled workflows, durable jobs, team updates and tenant-scoped operational views.

Identity/completeness checks, queue recovery and freshness states guard against misleading reports.

Business value: the product generates USD 1,000 in monthly recurring revenue as of 4 October 2026. The source remains private; capabilities can be reviewed in a confidential technical discussion. Technical depth: Python, FastAPI, PostgreSQL, SQLAlchemy, Playwright and Windows automation.

08 / Booking-linked Parking Benefits

Business need: complete a routine customer-service task across multiple parking providers without losing track of requests or applying the same benefit twice.

Implementation: built booking eligibility checks, customer request/status screens, store-specific provider adapters, durable queues and operator reconciliation. Write-intent records and idempotency protect the boundary between internal records and external coupon actions.

Business value: makes requests traceable and gives staff a clear exception path when a provider response is uncertain. Technical depth: Python, AWS Lambda, DynamoDB, SQS and HTTP/Playwright integrations.

ADDITIONAL DEVELOPMENT WORK

Booking-triggered customer notifications; review synchronization and controlled migration; Android message queue/retry recovery; Windows camera and photo-selection applications; privacy-conscious desktop reporting; product and industrial-service websites. Implementation and release maturity vary by project; photo-selection delivery retains real-world pilot gates before launch.
